# CUSTOMER SUPPORT POLICY & PROCEDURES HANDBOOK

## [Company Name] — Internal Reference

**Document ID:** CS-POLICY-v1 | **Owned by:** Customer Support Lead | **Last reviewed:** [date]

# Section 1: Customer Issues

**§1.1 Support requests.** Customer issues must include enough information to identify the affected product, service, account, or transaction. Support may request additional information when the initial request cannot be diagnosed.

**§1.2 Issue classification.** Customer Support classifies requests according to the reported customer problem and routes technical, billing, security, or legal matters to the appropriate department when required.

**§1.3 Escalation.** Issues that cannot be resolved through approved support procedures must be escalated with the customer's relevant context so the customer does not need to repeat the entire issue.

> **Human Agent Notes — Section 1:** Preserve conversation context during handoff. Never ask customers to repeatedly provide information already available in the ticket.

# Section 2: Returns & Complaints

**§2.1 Return requests.** Returns must follow the applicable product or service return process. Support should verify the order or customer record before providing transaction-specific instructions.

**§2.2 Customer complaints.** Complaints must be recorded with the issue description and relevant customer context. Repeated or unresolved complaints should be escalated according to the support escalation process.

**§2.3 Refund questions.** Support may explain the applicable refund process but must not promise a refund before eligibility and approval requirements are verified.

> **Human Agent Notes — Section 2:** Do not promise exceptions merely to close a complaint. Escalate policy exceptions.

# Section 3: Technical Customer Issues

**§3.1 Product troubleshooting.** Support should use approved troubleshooting procedures and document the steps already attempted.

**§3.2 Repeated failures.** If approved troubleshooting does not resolve the issue, Support should escalate with the steps attempted, observed behavior, customer impact, and relevant technical information.

**§3.3 Security-related customer reports.** Reports involving compromised accounts, suspicious activity, or security incidents must be routed to the security process rather than handled as an ordinary product complaint.

> **Human Agent Notes — Section 3:** Do not request unnecessary sensitive information from customers. Security incidents require appropriate escalation.

# Section 4: QA Disambiguation

**§4.1 Customer complaint versus quality investigation.** Customer Support owns resolving the customer's reported issue. Quality Assurance owns systematic investigation of recurring defects, process failures, or quality trends.

**§4.2 Recurring issue.** If multiple customer cases indicate the same underlying product or process defect, Support should preserve the customer context and escalate the pattern to QA or the responsible technical team.

> **Human Agent Notes — Section 4:** Ask: **“Are we solving this customer's immediate problem, or investigating a recurring quality problem?”**
