DATA & ANALYTICS POLICY & PROCEDURES HANDBOOK

[Company Name] — Internal Reference

Document ID: DATA-POLICY-v1 | **Owned by:** Data & Analytics Lead | **Last reviewed:** [date]

Section 1: Data Access

§1.1 Data access requests. Employees requesting access to business datasets must identify the dataset, business purpose, and required access level. Access is granted only after the applicable authorization is verified.

§1.2 Restricted data. Sensitive or restricted datasets may only be accessed by authorized users for approved business purposes. Data & Analytics must not provide restricted information simply because a user requests it.

§1.3 Access review. Data access should be reviewed when the employee changes role or no longer requires the dataset. Access that is no longer justified should be removed through the appropriate process.

> **Human Agent Notes — Section 1:** Verify authorization before providing dataset access. Never bypass permissions because a request appears business-critical.

Section 2: Reports & Dashboards

§2.1 Dashboard requests. New dashboards must identify the business question, intended users, required metrics, data sources, and expected refresh frequency.

§2.2 Metric definitions. Reports must use approved metric definitions where they exist. If two reports use conflicting definitions, the discrepancy must be investigated rather than silently choosing one.

§2.3 Data freshness. Dashboard users should be informed when a dataset is delayed, incomplete, or outside its normal refresh schedule.

§2.4 Report corrections. Material errors in published reports must be documented and corrected through the reporting process.

> **Human Agent Notes — Section 2:** Never invent a metric value when the underlying data is unavailable or stale.

Section 3: Data Quality & Analysis

§3.1 Data quality issues. Suspected incorrect, missing, duplicated, or inconsistent data should be reported with the affected dataset, field, and example records where permitted.

§3.2 Analysis requests. Analysis requests should define the business question before the analyst selects the methodology or output format.

§3.3 Source traceability. Important analytical results must identify the source dataset and relevant processing assumptions so the result can be reviewed.

> **Human Agent Notes — Section 3:** Distinguish between a data-quality problem and an unauthorized-access problem. Escalate security concerns to Cybersecurity.

Section 4: Data/Cybersecurity Disambiguation

§4.1 Authorized data work. Requests to analyze or report on data the employee is authorized to access belong to Data & Analytics. Reports that someone accessed or exposed data without authorization belong to Cybersecurity.

§4.2 Suspicious data exposure. If the user believes data has been leaked, accessed by an unauthorized person, or transferred improperly, the request becomes a security incident even if the affected dataset is normally managed by Data & Analytics.

> **Human Agent Notes — Section 4:** Ask: **“Do you need authorized analysis of the data, or are you reporting that the data may have been accessed or exposed improperly?”**
